

Comprehensive IT Operations Intelligence to drive faster operational performance

AppDynamics Unified Analytics platform provides real-time insights into IT operations, customer experience and business outcomes. AppDynamics Log Analytics is part of Unified Analytics platform to enable unprecedented comprehensive operational visibility and faster mean time to resolution with industry's first auto-correlated transactions and log data in real-time in production.

Application complexity is increasing and so is the need and dependency on software to provide exceptional customer experience and business agility. Machine generated data holds key to providing insights into complete operational visibility. AppDynamics Log Analytics solution collects, correlates, and analyzes your machine data to give you comprehensive real-time insights into operational performance.

KEY BENEFITS

- Easy add-on to AppDynamics products
- Get comprehensive IT operational intelligence in real-time
- Collect data from all sources including cloud and virtual environments
- Industry's first smart correlation between business transactions and log data to power deep performance insights and fast MTTR
- Rapidly visualize and analyze large datasets with interactive custom dashboards and set up metrics alerts. Easily share reports with teams and enforce privacy and access control through role based access control
- Big data platform designed to handle up to 1 Trillion events/day and keep up with changing structure and logic of fast changing apps
- Flexible hybrid SaaS deployment options — on-premises, SaaS, private or public cloud

Bring your structured or unstructured data

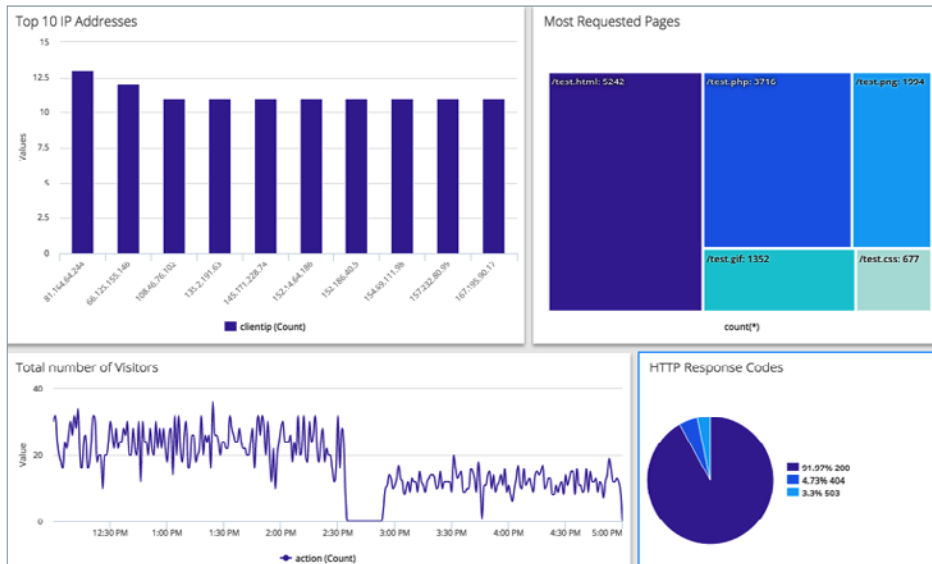

It is easy to collect any type of machine data to gain visibility into your infrastructure whether it is physical, virtual or in the cloud. Whether it is a server or load balancer or database or any other type of machine data, logs are simple to collect and index to gain full operational visibility.

Search for distributed logs with 1-click

AppDynamics Advanced Query language makes it easy to run powerful advanced searches to pinpoint errors and perform ad-hoc analysis to connect the dots. SQL syntax makes it easy to query unstructured data and gain comprehensive operational visibility beyond application code.

Resolve application issues faster with intelligent correlation between Transactions and Logs

Leverage the power of smart logs to correlate business transactions and log data. Industry's first such correlation allows IT / DevOps professionals to pinpoint errors, get full context and forensics behind the issues and achieve faster mean time to resolution.

Visualize trends, build interactive custom dashboards, and get reports

With many simple and advanced widgets to choose from, AppDynamics Log Analytics module makes it easy for both practitioner and manager to spot the trends, set up alerts, and isolate problems before they impact customer experience. You can also build interactive custom dashboards and easily share with others in the organization and/or set up periodic reports to senior management.
