The next generation of application performance management for your PHP applications

Get to the root cause of performance bottlenecks in your PHP applications with the AppDynamics Application Intelligence Platform. With AppDynamics, you can drill down into request stack traces to diagnose performance bottlenecks in your mission-critical PHP applications all while running in a live production environment.

The new world of distributed web applications has created a whole new set of challenges for those tasked with ensuring PHP application performance. With the shift toward service-oriented architectures (SOA) and microservices, PHP applications now operate in rapidly changing environments. As a result, performance problems surface that are often difficult to identify, diagnose, and fix.

As these applications become increasingly critical to the business, it’s more important than ever to have a simple yet fast way to monitor, diagnose, and resolve PHP application problems before they affect revenue.

AppDynamics allows you to monitor your PHP applications in production so you get real-time visibility of performance and can find the root cause of code bottlenecks in seconds, all with minimal overhead. The root causes of performance problems can be very different and complex to locate, while the result is usually simple - a slow or unavailable web site. AppDynamics reveals the internals of your application and infrastructure through process-level code visibility and proactive monitoring enabling detailed analysis, fast troubleshooting, performance and capacity optimization. We allow companies to monitor, troubleshoot, and diagnose their production applications, gaining 10x their current level of visibility and getting to root cause 90% faster.

KEY BENEFITS

- Improved visibility in a distributed environment
- Rapid troubleshooting that reduces Mean-Time-to-Resolution from hours to minutes
- Increased IT agility that allows for rapid deployments and code changes— even in high-volume production environments
- Production ready monitoring for PHP, Node.js, Java, .NET, and Python environments – monitor any stack separately or together

“We chose AppDynamics for its ease of use, rich functionality and low overhead ... it’s a powerful tool that every engineer will be able to learn from.”

Ryan Aylward, CTO
Glassdoor

Key APM features

- **Business transactions**: automatic detection, response time, calls per min, slow, very slow, stalls

- **Transaction snapshots**: code level diagnostics showing complete call graphs and code execution, policy-based collection available

- **SQL statement visibility**: PDO statements & prepare statements, remove sensitive data

- **Errors**: transaction errors, backend errors

- **Application flow map**: visualize application dependencies

- **End user experience management**: browser diagnostics correlated with server-side diagnostics

- **Real-time analytics**: automatic baselining and scoring of application and transaction performance

- **Distributed transaction tracing**: correlation of distributed transactions from multiple tiers

- **Performance**: low overhead and designed for extremely high traffic production applications

- **Data collectors**: track and correlate any data from a user request to your business transactions

- **Information points**: track and baseline any metric from your application without code changes

- **Change detection**: record application change events like deployments and upgrades

- Custom dashboards help your team understand the health and performance of your PHP application in record speed
